Crime Against Women in India (2018–2022)

A Data-Driven Analysis Using Power BI

Abstract

This project analyzes district-wise crimes against women in India (2018 onwards) using cleaned government data visualized in Power BI. The dashboard highlights rising crime areas, regional differences, and districts where women are most unsafe. These insights support data-driven policies and targeted interventions.

Objectives

- Analyze year-wise trends and patterns of crimes against women in India.
- Highlight regions with consistently high or low crime rates.
- Derive insights using Power BI dashboards and DAX metrics.
- Recommend policy measures based on observed trends.

Motivation

Crimes against women affect safety, economic participation, and national development. This issue aligns with UN SDGs 5, 11 and 16. The topic was chosen for its social significance, public attention, and governance impact, with structured government data enabling a rigorous, non-partisan analysis.
